## Contents

1.INTRODUCTION.....	2
2.FURTHER DETAILS.....	3
2.1.Changes to the Message System.....	3
3.CR SUMMARY.....	4

## **1. Introduction**

QA C 7.1.1 is a patch release that fixes some critical bugs.

## **2. Further Details**

### **2.1. Changes to the Message System**

There are no changes to the message system in this release.

### 3. CR Summary

The following table summarises the change requests (CRs) that have been implemented in QA C 7.1.1:

CRs have been categorised into 3 types (column "T"):

**C** – A significant change has been implemented to existing behaviour.

**F** – A fix of a bug or problem feature.

**N** – New functionality has been introduced.

Some CRs are associated with more than one category and in some cases, the distinction between categories is a little blurred. The classification should therefore be treated as a guide only.

CR	T	Resolution
12680	F	In Auto-create and Folder params windows, a succession of Edits and Cancels on any personality entry was causing the compressed text entry (e.g. C:\..\person\default.p_s) to become the real entry, and therefore greying out of Edit
12707	N	Windows GUI Relationships now show recursive links in red & dashed lines
12791	F	GUI-only license failure was occurring on multi-core machines
12807	N	Project file extensions other than .prj can be opened from cmd line activation
